Final Report

Saif Ezzat.

During the NCAE game early in the semester we were a team of 10 as of everyone in the class. Once the competition started, I asked to take care of the router. As per my preparation for the games, I watched all videos published by the officials and spent well over 10 hours practicing how to work with sandbox. The first step in each proceeds was setting up the router to behave as needed. So, I enter the shell with the new password we created as a team. Configured the router to block any external traffic and when the server was ready, I was able to route the traffic to allow the server through the external network. Thankfully the router shell was never hacked and was always running throughout the whole competition.  As a team we felt like we did great. We felt like we could have been more prepared. It was existing to stay that tense for over 8 hours. I asked my classmates and team members about my performance after the competition they all said that I did alright. They felt that I accomplished the task I asked for asked as good as I can.

As an overall I enjoyed the experience and learned a lot about network and traffic control.
